LOST SALES DATA. A CONSIDERED NEXT STEP.

Recovery intelligence with evidence in view.

LostDeal AI helps a business review closed-lost quotes, understand recorded blockers and decide which conversation deserves another look. It is a genuine multi-tenant SaaS; this presentation uses a separate synthetic companion showcase.

Companion showcase screenshot. Fictional sales note and manually authored, precomputed analysis; no live provider execution or customer data.

The problem

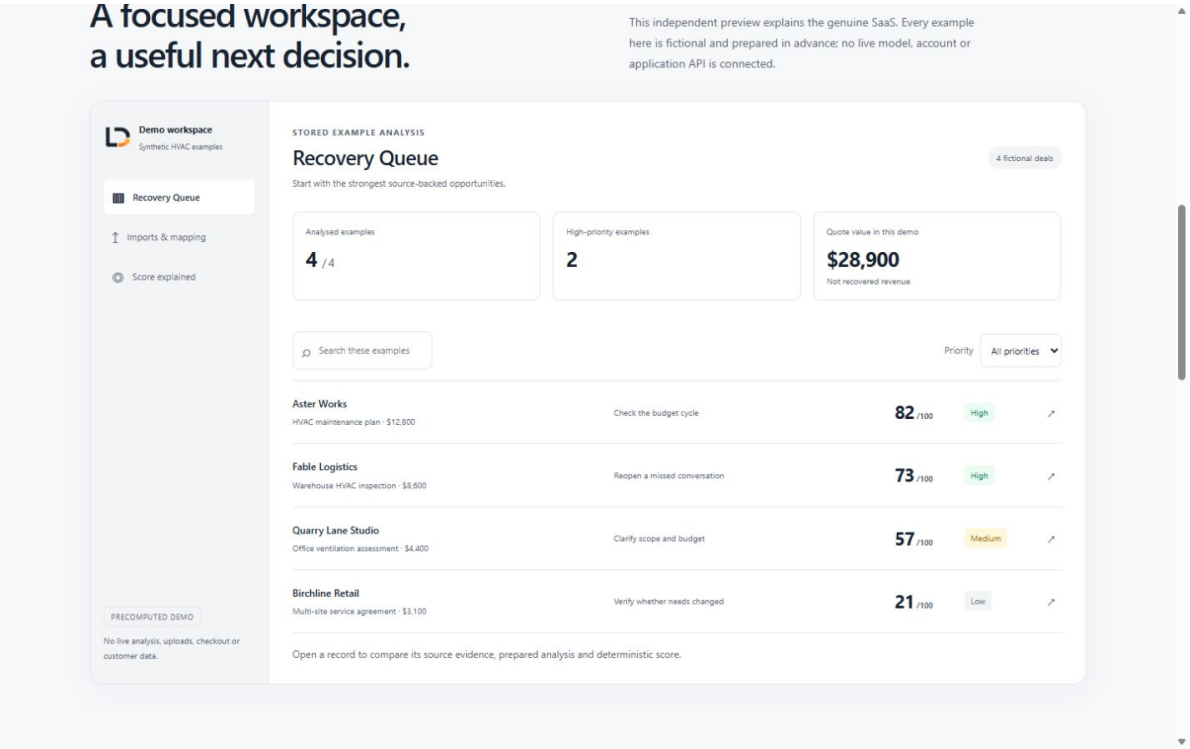

Lost quotes often leave context scattered across CSV exports and notes. Timing, a missed follow-up and poor product fit need different responses. A list of lost deals alone does not establish what is actionable.

The value proposition

Turn authorized source records into evidence-backed interpretation and a transparent review order. Keep the final judgment and outreach with a person. No recovered-revenue, conversion-improvement or customer-outcome claim is made.

THE END-TO-END PRODUCT WORKFLOW

Prepare. Understand. Prioritize. Review.

Synthetic companion queue. Quote values are not recovered revenue. Prepared scores use the unchanged genuine scorer as of 12 October 2026.

01 / Prepare the data

Smart Import maps and validates CSV rows before explicit import. Eligible Auto Convert proposes unresolved structured facts with source provenance into the same review pipeline.

02 / Interpret the source

Standard retains bounded evidence, Buying Intent and recovery suggestions. Eligible Deep adds strategy and caution. Notes remain source data, and a person reviews any follow-up.

03 / Calculate review priority

Code applies 50% intent + 30% reason recoverability + 20% recency, adjusted by confidence and caps. This is review priority, not sale probability or a revenue forecast.

04 / Inspect before acting

Overview, Deal Detail, Recovery Queue and Insights connect stored intelligence to a human decision. Opening stored valid analysis makes no new model call.

REAL ENGINEERING. HONEST ACTIVATION BOUNDARIES.

A premium interface. A careful foundation.

React + TypeScript	Responsive workspace and product surfaces
Vinext / Cloudflare Worker	Auth, server validation, origin checks and request limits
Supabase Auth / PostgreSQL	Workspace membership, RLS and narrow protected RPCs
OpenAI / Paddle Sandbox	Explicit bounded AI and verified billing lifecycle foundation

Controls behind the interface

Server-owned identity, tenant ownership and plan state govern protected work. Strict schemas, source checks, reservations, operation identities and staged finalization support explicit AI workflows. Immutable migrations, build/artifact checks, source/history scans and private regression evidence preserve an auditable project. These are specific engineering controls, not a compliance certification.

Starter and Pro: current product catalog

Per usage period	Starter / $15 USD monthly	Pro / $45 USD monthly
Imported deals	250	1,500
AI analyses	30 Standard	250 shared Standard / Deep
AI mapping requests	3	30
AI Auto Convert rows	Not included	1,500

Commercial activation remains pending

Domain/email control, hosted Auth delivery, provider/security acceptance, spending controls, alert delivery, backup/restore acceptance and actual Paddle Live/payment lifecycle tests remain separate. The full SaaS is preserved; this companion has no account, upload, protected API, checkout or contact collection.

No testimonials, customer logos, revenue outcomes, independent penetration test or uptime SLA are claimed. Personal contribution statements must accurately describe the owner-directed, AI-assisted development process.
